THE MESOCOSMOS AND BIOLOGICAL ARCHITECTURE.

2.23- The Aurometer or biotensor

It is a very flexible metal rod or a spring that is held with a handle and at the tip has a cone or heavy cylinder. It is a combination of rod and pendulum. It is used horizontally (like rods). The aureometer, stands out among the radiesthesia instruments, for providing four types of movement in response: horizontal oscillation, vertical oscillation, right turn and left turn. Its most common use is to measure the energy of objects, people, and places.
