## MICROCOSM AND FRACTAL SCIENCE

### *3.3- The Standard Model of Contemporary Physics*

The 1900s brought many new developments to the model of modern physics, especially in the formulation of the standard model of particle physics. However, many of the problems have yet to be resolved. Its most enormous deficit is the complete inability to explain one of the most prominent experimental forces in the universe: gravity. While there have been many proposals for a theory of “gravitons” as the gravitational force of gravity, it is commonly considered impossible to detect this version of gravity particles with physical apparatuses.
