THE 5 ELEMENTS IN BIO-ARCHITECTURE BY JUAN SCHLOSSER

8.2- Water: restructure devices, presence of water features, biomimicry, regenerative design

Water = Water attracts the lifeforce, or chi energy, when flowing in its natural pathways. Our world's water sources are heavily depleted energetically, as our water is full of chemicals. Water is the lifeblood of our environment and thereby of our communities. We acknowledge its profound connection to the aether, being the bridge to life, which is why we honor water's inherent nature throughout our designs.

It is well documented that the presence of water bodies have a beneficial effect upon health and wellbeing. It is said in the art of Feng Shui that water attracts chi. Places where water flows have higher concentrations of negative ions which exhibit healing and consciousness enhancing properties. These properties can be amplified by the use of water restructuring systems, which generate highly charged water, the presence of which energizes the environment in which the water is present.

Restructured water:

Can be described as a type of state of water, in which the clusters of molecules are in a condition of high coherent order, in which the structure of these clusters is in a geometrical equilibrium, adapting different, metastate type dynamic structures, mostly linked to tetrahedral, dodecahedron, icosahedron and other related complexes of polyhedral. This is the cause of the physical decrease of surface tension, making the water more hydrophilic more absorbable by the body. Restructured water also

Leonardo Da Vinci vortex studies and anatomical drawings of the Human heart

binds more oxygen and imparts a negative charge known as zeta potential, conductivity increases and viscosity and surface tension are decreased, which when consumed, increases blood fluidity. Similar beneficial effects will take place in plant life.

Water bodies:

Play a special function in the design and energetic quality of the space. Water is a living element that is intimately linked to ether, in fact can be seen as the gate and access to the aether. As it plays an intrinsic function in all biology and is also found as an important component in some of the most ancient temple design of antiquity, including the Giza pyramids.

Water ponds and rain water collectors are an intrinsically important part of the bio-design concept while also performing a functional aspect of collecting water that will be used in different areas and for different purposes. Water also becomes an important energetic aspect of the design; concentric rings of water have an energetic effect that generate life force, (as a water type Orgone accumulator), and can be beautifully integrated in the design of the landscape. Use of specific shapes to contain and store water can be selected to maintain and support its energetic function. Shapes that are connected to the molecular structure of water can energize water thus creating morphic resonance effects. The shape of the water pipes used on the buildings should be energetically optimized to create a torsional motion in the interior of the pipes while straight lines should be avoided where possible.
